

Two Suns

Student Datasheet ...

- What have we discovered about most stars in the sky?

- Why did it take us so long to find out?

- Where did we find the first star that led to this discovery? (What's the name of the group of stars that form a shape by "connecting the dots"..?)

Something else to think about...

Do you think planets could form around a double star..? We have already discovered planets that do..! It appears planets can form around double stars that are close together, so the planets circle around both of them. (Just like the planet in Star Wars!)
