Housing Quality in Arkansas: County Profiles by Census Tracts

Rita D. Conley and Jacquelyn W. McCray

INTRODUCTION

This report presents an overview of selected housing quality indicators reported in the latest (1990) decennial census report for each Arkansas county and census tract or block numbering area (BNA). Because communities differ in resources and other characteristics, specific data for smaller population divisions are needed to assess area-specific problems and to find workable solutions. *Housing Quality in Arkansas: County Profiles by Census Tracts* is the second of two special reports designed to provide a comprehensive profile of housing data by state, region, county and census tract divisions. *Housing Affordability in Arkansas: County Profiles by Census Tracts*, released in March of 1995, was the initial publication in the series (McCray and Conley, 1995). The fundamental purposes of this report are to 1) provide an easily accessible description of housing in the state, 2) review geographic patterns of housing quality across the state and 3) document the magnitude and location of the state's most critical housing problems.

Some 14 variables were selected from 1990 census data and evaluated as indicators of housing quality to

accomplish these purposes. These variables delineate differences in tenure, structure-type, house values, availability of public water and sewer facilities and plumbing and crowding conditions. The absence of enumerator evaluations in census data collection suggests that any measure of housing quality as reported by the household is fundamentally arbitrary. Nonetheless, census data provide the only comprehensive information on the nation's housing stock.

Housing quality is a comprehensive concept that delineates whether or not housing is sufficient to meet recognized housing quality standards as well as specific household needs. Generally, structural condition is the most visible component associated with housing quality, but a comprehensive view of housing quality encompasses many quality measures, including plumbing facilities, persons per room, age of dwelling and house value as well as affordability requirements, access to public water and sewer, structure types and homeownership issues. Water supply, sewage disposal and sources of house heating fuel also serve as indicators of housing quality. Rural areas are more prone to problems in these areas than urban settings.

The availability of public water and sewer systems, in part, is dependent on availability of funding and adequacy of infrastructure. In many rural areas the spatial location of housing units is a major problem in expanding water and sewer systems. An important step in clarifying housing needs of Arkansas residents is to review the status of the housing stock in small geographic areas (census tracts or BNAs) relative to these variables. The relative degree of housing quality defined by these variables can be ascertained by comparing data for census tracts and BNAs to state averages. The state average then becomes the benchmark for determining levels of housing problems in smaller divisions.

The percentage of housing units per unit area (county, region and state) with specific housing attributes or deficiencies is compared to determine the areas of greatest need. These comparisons indicate if the area's housing stock is similar to housing in general for the state or if housing problems are more isolated and geographic in nature. Additionally, the presentation of variables by census tract and BNA also provides planning details for smaller jurisdictions.

Research variables studied are presented in two groupings (Fig. 1). Group one variables, sources of water and sewage facilities, are reported for all housing units. Group two includes only those variables reported for occupied housing units, i.e., occupancy status and housing stock characteristics, as well as housing value, cost and house heating fuel. From these two groups of variables, inferences are made about the overall quality of housing in the state given the absence of specific structural evaluations.

Fig. 1. Research Variables.

| Group 1 All Housing Units | Group 2 Occupied Housing Units |
|------------------------------|---|
| Sources of water | Tenure by units in structure |
| Sewage facilities | Year structure built |
| | Plumbing facilities |

| | House value |
| | Percentage of units costburdened |
| | Gross rent |
| | House heating fuel |

BACKGROUND

Elements of the Problem

According to Huttman (1991), most Americans continue to dream about a nice place to live. Such images include ownership of single-family housing in the suburbs. While opportunities for securing safe and decent shelter are taken for granted by many, the fulfillment of this aspiration is distant for many other households.

Housing Quality Measurement

The Housing Assistance Council notes that despite dramatic improvements in housing quality since 1970 (decennial census figures), extreme caution should be used when drawing conclusions about overall improvements in rural housing quality. The council suggests that the census report is more likely to undercount rural than urban housing and that rural units in remote areas and those renter-occupied, which are frequently sub-standard, are most vulnerable to undercounting. Also, the 1990 definition of complete plumbing (the most widely used measure of housing quality) is not totally comparable with definitions used in 1970 and 1980, as the 1990 definition does not require "exclusive use" as did earlier definitions. Because of the change in this important quality measure, approximately 25% of the housing units classified as lacking complete plumbing in 1970 and 1980 would be classified as having complete plumbing in 1990 (Housing Assistance Council, 1994).

Although the assessment of plumbing conditions and persons per room (crowding) is the established standard on which housing quality is judged, numerous other housing characteristics warrant consideration when assessing housing quality. Such measures include a number of variables related to heating and air conditioning, structural conditions, state of repair and others that are difficult to assess given the methodologies employed in collecting census data. Yet the decennial census remains the most important data source for assessing housing progress over time and for making comparisons between groups and areas.

Economic Status of Rural Households

Rural America faces many challenges in moving into the 21st century. To understand the multiplicity of problems, one must understand the diversity of rural communities and residents. Although some rural areas have made great strides in the past 50 years, many are

still struggling with poverty, unemployment, inadequate infrastructure and a lack of viable economic opportunities (USDA ERS, 1995).

Across the nation, poverty levels in rural areas have been consistently and persistently higher than those in metropolitan areas. Rural households and families are more likely than their urban counterparts (16.3% versus 12.7%) to be in poverty—a situation that has persisted since at least 1959 (Garovich and Harris, 1994). The current economic recovery has done little to raise incomes at the low end of the distribution. More than 13 million households in the United States still live in poverty (Joint Center for Housing Studies of Harvard University, 1994).

The economic status of rural households is dependent upon many community and household characteristics. These characteristics include educational attainment, levels and sources of income, population characteristics and health status. The quality of housing in any given area is directly linked to the economic status of the community and its residents and to the cost and availability of standard housing.

Arkansas residents receive 48.7% of their earnings from the services sector followed by 23.1% from manufacturing. Farm earnings account for only 6.8% of the personal income of Arkansas residents. The success of the agricultural industry has benefited many while causing economic hardship for others. A surplus of farm laborers exists because fewer laborers are needed to produce agricultural products and these laborers lack appropriate skills to move into non-production-related agricultural jobs. Additional jobs are needed in other sectors of the economy such as services or manufacturing to replace jobs lost in the farm sector. Arkansas has 27 counties considered farm counties (at least 20% of earned income from agriculture, forestry and fisheries), as compared to 22 manufacturing counties (those with at least 30% of earned income from the manufacture of goods) (USDA ERS, 1995).

Financial Resources for Housing

The shortage of affordable housing in prosperous suburban areas, along with persistent poverty and housing market discrimination, has contributed to the spatial isolation of the poor in economically depressed sections of urban centers and outlying rural areas (Joint Center for Housing Studies of Harvard University, 1994). Forty-three of the 75 counties in Arkansas have $\geq 20\%$ of their population below poverty. The average

percentage of persons below poverty in the state is 18.5%. In fourteen Arkansas counties, $\geq 20\%$ of the families have incomes below \$10,000.

Summary

A combination of factors work together in aiding or impeding a community's ability to adequately house its residents. Many limiting factors associated with housing quality are related to the economic viability of the community and its residents. Equally important is the availability of affordable standard housing units. Specific elements used to measure housing quality play a major role in defining adequate housing. Not only must the measurement of housing quality include units lacking complete plumbing facilities and units with 1.01 or more persons per room, it must also include the whole spectrum of housing features and attributes that affect the adequacy of the unit in meeting basic housing needs. Toward this end many factors are reviewed to determine the housing adequacy in a particular region, county, census tract or BNA.

RESULTS AND DISCUSSION

Eight tables, 10 maps and 11 figures are provided in this report. Appendix Tables 1-6 present housing quality data by county and region, while Table 7 breaks down county data by census tract and BNA. Table 8 notes geographic regions of the state's 75 counties. Map appendices provide a visual picture of housing quality by county and reveal geographic concentrations of housing patterns across the state. Eleven charts (Fig. 4 to 11 in the appendices) compare housing characteristics by region and state. A summary of the major trends and issues identified are discussed in this section. Persons desiring specific information on housing quality indicators for the state, regions, counties or census tracts and BNAs are referred to the comprehensive data presented in the appendices.

Indicators of Housing Quality

Tenure

Whether or not a housing unit is owned or rented has been linked to various social benefits, including greater life satisfaction, greater self-esteem among children, family stability and a sense of achievement, to name a few. Because of these specific benefits, homeownership is valued greatly by most Americans,

and it is a major source of capital asset building for most families. According to the results of the 1994 Fannie Mae National Housing Survey that included 1,403 interviews in all regions of the country, an overwhelming majority of Americans prefer to live in communities where the majority are homeowners (Fannie Mae, 1994). More than 70% of all respondents cited a hypothetical town where 80% of the residents were homeowners as a preferable place to live. Reasons for this preference are stability of residents and quality of neighborhoods. The decision to own or rent a home is largely dependent upon household financial resources, desired location for housing and size of home needed. Besides cost factors, another constraint to obtaining housing desired is availability of housing that meets all household needs. The availability of amenities often affects the decision to own or rent housing. Typical amenities for owned units are inside and outside space, location, environment and others. Although renter units have desirable amenities as well (low maintenance responsibilities), the cost of housing in the owner market often restricts limited-resource households to rental units that may not be adequate for their needs. The distribution of occupied housing units owned and rented in 1990 is presented in Appendix 1, Table 1. More than six out of 10 (61%) are owned, single-family units, compared to less than one in six (15.4%) rented, single-family units. Close to 12% of the occupied housing units were owned mobile homes, and 7% were rented multifamily units. For residents in 44% of Arkansas counties (33), the homeownership rate of single family units was less than the state average. Seven of these counties are located in MSA's that generally have more rental units. On the other hand, over 50% of Arkansas counties have a percentage of owner-occupied units higher than the state average (61%). Generally, Arkansas residents desire to own single-family housing. However, residents of counties located along the Mississippi Delta Region of the state have less success at homeownership, indicated by the lower percentages of owner-occupied, single-family units, which ranged from 45.9 to 56.9%. Data reveal that after owned, single-family units, rented, single-family housing and owned mobile homes are the most important sources of housing in the state.

Public Facilities

Rural areas are frequently prone to problems related to the availability and quality of public water and sewer facilities. In 20 Arkansas counties (26.7% of all counties), at least 40% of all housing units do not have access to a public water system. A few counties (three) have 60% or more housing units with water sources other than public or private systems. These counties are located in the northwestern section of the state. Public systems for sewage disposal are less prevalent than public water systems. Appendix 1, Table 2 shows that in 42 Arkansas counties (56% of all counties), 50% or more of the housing units use septic tanks, cesspools or other non-public means for sewage disposal.

Age of Housing Stock

Appendix 1, Table 3 presents data on age of the housing stock in Arkansas by county. Data are presented for dwelling units built before 1970, units built between 1970 and 1984 and units built since 1985. The percentage of owner-occupied housing units built before 1970 ranged from a low of 23.4% in Faulkner County to a high of 46.5% in Union County. One-third or 33.4% of owner-occupied housing units in the state were built before 1970.

Plumbing Facilities and Crowding Conditions

Almost 9,830 housing units in non-metropolitan areas in Arkansas lack complete plumbing facilities, and 20,200 housing units are overcrowded (Appendix 1, Table 4). Together, more than 43,165 (4.8% of all occupied units) housing units were considered substandard in 1990. There were 25,034 substandard housing units in rural areas and 18,131 in urban areas.

Minority households occupy only 14.7% of all the housing units in the state but were more than twice as likely as white households to live in substandard housing. Only 1.1% of occupied housing units with white householders lack complete plumbing while 3.6% of housing units occupied by minority householders lack complete plumbing. The counties with the highest concentration of occupied housing units lacking complete plumbing are shown in Fig. 2. Figure 3 shows the counties ranking highest in the percentage of housing units with 1.01 or more persons per room. These housing quality problems are closely related to the higher-than-average poverty rates in these counties.

*Costburdened: 30% or more of income for selected mortgage costs.

Fig. 2. Rank and percentage of housing units lacking complete plumbing.

| Rank | County | Percentage Lacking Complete Plumbing |
|------|-----------|--------------------------------------|
| 1 | Newton | 11.7 |
| 2 | Searcy | 9.3 |
| 3 | Madison | 6.1 |
| 4 | Stone | 5.7 |
| 5 | Lee | 5.0 |
| 6 | Lafayette | 4.9 |

Fig. 2. Rank and percentage of housing units with 1.01 or more persons per room.

| Rank | County | Percentage with 1.01 or more persons/room |
|------|------------|---|
| 1 | Lee | 8.3 |
| 2 | Phillips | 8.2 |
| 3 | Chicot | 7.8 |
| 4 | Crittenden | 7.5 |
| 5 | Desho | 7.0 |
| 6 | Lafayette | 4.9 |

House Value, Rent and Costburdened Units

Appendix 1, Table 5 shows the value of specified owner-occupied housing units and costburdened* owner units. The median house value of a particular county indicates that 50% of the specified owner-occupied housing units are above this value and 50% are below. Six counties in the state have median house values of \$30,000 or below: Lafayette, \$24,300; Chicot, \$28,700; Clay, \$28,900; Searcy, \$29,400; Woodruff, \$29,700; and Nevada, \$30,000. On the other hand, there are 10 counties with median house values of \$50,000 or more: Pulaski, Saline, Benton, Washington, Faulkner, Garland, Lonoke, Baxter, Cleburne and Craighead. As expected, these counties enjoy higher incomes and a concomitant lower percentage of persons below the poverty level. The median house value for the state is \$46,300.

Many renters are unable to find adequate affordable housing since they often have lower median incomes and higher poverty rates than that of homeowners. The median gross rent of 18 counties in Arkansas is \$150 or below (Appendix 1, Table 6). Median gross rents, like median house values, are associated with housing quality. Lower costs of rental units may mean that the quality of these units is lower as well. While 7.5% of the occupied rental units lack complete plumbing, are overcrowded or both, only 3.7% of owner-occupied housing units are substandard by these definitions.

A comparison of the percentage of costburdened units of owners and renters reveals that a sizeable number of renters in all Arkansas counties live in costburdened units. While the percentage of costburdened owner units ranged from 12.7% in Saline County to 31.6% in Chicot County, the percentage of costburdened units for renters ranged from a low of 22.4% in Calhoun County to a high of 48.7% in Phillips County. The data clearly suggest that the problem is more severe for renters than for owners. Ten counties had 40% or more of rental units costburdened. Six of these counties were located in the Delta region of the state. There were 11 counties with 20% or more of the owner-occupied housing units costburdened. A lack of affordable housing keeps many of these households locked in inadequate and/or cost-burdened housing.

Arkansas Regions

Differences in demographic and economic characteristics across the state directly affect the characteristics of the housing stock in a particular region. Regional classifications from a previous study (Rural Profile of Arkansas, 1993) were used to divide the 75 Arkansas counties into five groups (Appendix 1, Table 8). The 10 metropolitan counties comprised the Urban group. The 65 remaining counties were grouped into four rural regions based upon similarities in economic, historic and physical characteristics and settlement patterns. The rural regions were Coastal Plains, Northern Highlands, Southern Highlands and the Delta. The data reveal differences in housing stock characteristics in these regions.

Dwelling Types

Arkansas has a total of 891,179 occupied housing units. The largest number of occupied housing units were in the Urban region followed by the Northern Highlands, the Delta, the Southern Highlands and the Coastal Plains. Housing tenure by units in structure for counties and regions is shown in Appendix 1, Table 1.

The Northern Highlands region has the highest percentage of owned, single-family housing units (64.6%) followed by the Coastal Plains region with 61.3%. The Southern Highlands region ranked third with 60.8%. The Delta region has the lowest percentage of owned single family units (55.5%), which coincides with a high percentage of single and multi-family rental units—19.6% and 11.8%, respectively. The percentage of owned, single-family units in the Delta was slightly less than the percentage for the Urban counties (56.8%).

Mobile manufactured units were most prevalent in the Coastal Plains and the Southern Highlands regions. These units comprised 15.5% of the housing stock in each region. The Northern Highlands region followed with 14.1%. It is clear that mobile manufactured housing units are an important source of affordable housing for these regions. Mobile manufactured housing units are least prevalent in the Delta (11.1%) and in the Urban counties (9.9%). At least 15.2% of the occupied housing stock in the state are mobile manufactured units.

Water, Sewer and Heating Fuel

Sources of water, sewage disposal and house heating fuel by county and region are presented in Table 2. The Urban counties and the Delta region had the highest percentage of housing units with a public water system, 91.2% and 89.9%, respectively. All other regions were below the state average of 81.5%—Coastal Plains (78.0%) Northern Highlands (67.6%) and Southern Highlands (66.9%).

Most of the housing units in the Northern Highlands region used a septic tank or other means for sewage disposal (61.1%). Only 38.9% of the housing units were on a public sewer system. About 55.6% of housing units in the Coastal Plains region used a public sewer system, followed by the Southern Highlands at 52.5%. The Delta region and the Urban counties were the only regions above the state average of 60.1%, with 66.7% and 73.9%, respectively.

Utility gas and electricity were the most widely used sources of fuel. The percentage of units fueled by gas or electricity ranged from 88.3% in the Urban counties to 58.3% in the Northern Highlands region. However, 25.6% of the housing units in this region used a fuel source other than utility gas, electricity or bottled LP gas.

Age of Housing Stock

About 13.1% of the occupied housing stock in the Northern Highlands region had been built since 1985. Approximately 11.8% of the occupied units in the Southern Highlands were built before 1970. The percentage of units built before 1970 was about 12% for the Urban counties and 11.9% for the state. The percentage was 10% or less for the remaining regions.

The Coastal Plains region had the highest percentage of occupied units built before 1970 (56%). About 41.3% of these units were owner occupied, and about 14.7% were renter occupied. The Delta region was a

close second with 53.4% of occupied housing units built before 1970. However, this region also had the highest percentage of occupied rental units built before 1970 (18.2). The Northern Highlands had the fewest units built before 1970 (40.9%). The percentage of units built before 1970 in the Southern Highlands and Urban counties was slightly more than the state average of 48.0% with 48.9% and 48.1%, respectively.

Plumbing Facilities and Crowding Conditions

The percentage of units lacking complete kitchen and plumbing facilities and the percentage of units crowded by region was small on average. The range of the percentages from lowest to highest for units lacking a complete kitchen facilities was 1.1% (Urban) to 2.2% (Northern Highlands). The percentage of occupied housing units lacking complete plumbing ranged from 0.9% (Urban) to 2.6% (Coastal Plains). The percentage of crowded units was higher than the percentage of units lacking complete kitchen and plumbing facilities in all regions. At least 3.7% of occupied housing units in the Urban counties and 4.7% in the Delta region had 1.01 or more persons per room. The state average was 3.7%.

House Value and Costs

The Coastal Plains and the Delta region had the highest percentage of units valued at less than \$15,000 (14.8% and 12.7%, respectively). These two regions also had the lowest median house values (Coastal Plains, \$35,383; Delta, \$35,794). The Urban and Northern Highlands regions had the highest percentage of units valued at \$50,000 or more. The median value of owned housing units in the Urban counties was \$51,240 while the median value in the Northern Highlands was \$41,192. Median house values in all regions except the Urban counties were below the state median of \$46,300.

Data revealed that costburdened housing units were more of a problem in the Delta, Coastal Plains and the Southern Highlands regions than in Urban counties or the Northern Highlands. About 20% of the housing units in the Delta, 18.3% of housing units in the Coastal Plains and 18.2% of the housing units in the Southern Highlands had housing cost requiring 30% or more of the household income. The percentage of units costburdened in the Northern Highlands and the Urban counties was close to the state percentage of 17.9%. Both regions were below the state average with Urban at 10.0% and Northern Highlands at 17.7%.

Over a third of rental housing units in each region were costburdened. The Delta had the highest percentage with 37.7%, while the Northern Highlands had the lowest percentage (34.4%). The percentage of costburdened units for the state was 36.5%. The Northern Highlands and the Coastal Plains region were below the state percentage with 34.4% and 35.6%, respectively. As expected, the highest median rent was in the Urban counties (\$244) followed by the Northern Highlands (\$192). The lowest median rent was in the Delta (\$156) followed by the Coastal Plains region at \$170. Median rent in the Southern Highlands region (\$180) was closest to the \$183 state median.

SUMMARY AND CONCLUSIONS

These data are useful in discerning patterns of housing characteristics across the state. The Northern Highlands region had the highest percentage of homeowners followed by the Coastal Plains region. The Northern Highlands also had the highest percentage of housing units lacking complete kitchen facilities, while the Coastal Plains region had the highest percentage of units lacking complete plumbing. The Northern and Southern Highlands have the lowest percentage of housing units with public water and sewer. As expected, higher incidences of incomplete plumbing facilities occur in regions with lower percentages of housing units on public or private water and sewer systems.

Residents of the Delta region were less successful in achieving home ownership than residents of the other regions. The Delta also had a higher percentage of housing units costburdened and crowded than other rural regions of the state. In terms of infrastructure, the Delta had the second highest percentage of housing units with public water and sewer systems, second only to the Urban counties. Urban counties also had the highest median house value followed by the Northern Highlands region. Six counties had median house values below \$30,000; three are located in the Delta, two are in the Coastal Plains region and one is in the Northern Highlands region. On the other hand, 10 counties have median house values over \$50,000. Five are Urban counties, three are located in the Northern Plains, and one each is in the Southern Plains and Delta region. The housing stock of the Urban counties and Northern Plains was generally newer than that of other regions of the

state with more housing units having been built since 1985.

Mobile manufactured housing units are more prevalent in the Coastal Plains and Southern Highlands regions. Mobile manufactured housing is an affordable housing choice selected by many households in the state. Approximately 15% of the occupied housing stock in Arkansas consists of mobile manufactured housing units.

This research provides insight into differences and similarities in housing stock characteristics of Arkansas counties and regions and, concomitantly, a general perspective on housing quality parameters. While a census tract can provide a more in-depth examination of the housing conditions of a particular area, the same data by county and region can give a more general view of the type and magnitude of housing activity in a particular geographical area. These data are helpful in documenting the need to identify forces that create and impede the delivery and maintenance of quality affordable housing in particular geographic areas. As all rural areas are not alike, many differences and similarities exist. Tailoring local policies and development approaches to specific local conditions can only be accomplished when accurate and defensive measures of local conditions are available. These data respond to that need.
